#### Curvature tensor of a holomorphic vector bundle

Let X be a complex manifold,  $n = \dim_{\mathbb{C}} X$ , and (E, h) a holomorphic vector bundle of rank r equipped with a hermitian metric h. With respect to a local holomorphic frame  $(e_{\lambda})_{1 < \lambda \leq r}$ 

 $\langle u,v\rangle = \sum h_{\lambda\mu}(z)u_{\lambda}\overline{v}_{\mu}, \quad u,v\in E_{z}.$ 

#### Curvature tensor of a holomorphic vector bundle

Let X be a complex manifold,  $n = \dim_{\mathbb{C}} X$ , and (E, h) a holomorphic vector bundle of rank r equipped with a hermitian metric h. With respect to a local holomorphic frame  $(e_{\lambda})_{1 < \lambda \leq r}$ 

$$\langle u,v
angle = \sum h_{\lambda\mu}(z)u_{\lambda}\overline{v}_{\mu}, \quad u,v\in E_{z}.$$

The Chern curvature tensor of (E, h) is defined to be the global (1, 1)-form  $\Theta_{E,h} \in C^{\infty}(X, \Lambda^{1,1}T_X^* \otimes \text{End}(E))$ 

$$\Theta_{E,h} = \frac{i}{2\pi} \sum_{1 \le j,k \le n, \ 1 \le \lambda, \mu \le r} c_{jk\lambda\mu}(z) \, dz_j \wedge d\overline{z}_k \otimes e_{\lambda}^* \otimes e_{\mu}$$

locally computed as the matrix  $-\frac{i}{2\pi}\overline{\partial}(\overline{H}^{-1}\partial\overline{H})$  where  $H = (h_{\lambda\mu})$ .

## Curvature tensor of a holomorphic vector bundle

Let X be a complex manifold,  $n = \dim_{\mathbb{C}} X$ , and (E, h) a holomorphic vector bundle of rank r equipped with a hermitian metric h. With respect to a local holomorphic frame  $(e_{\lambda})_{1 < \lambda < r}$ 

$$\langle u,v
angle = \sum h_{\lambda\mu}(z)u_{\lambda}\overline{v}_{\mu}, \quad u,v\in E_{z}.$$

The Chern curvature tensor of (E, h) is defined to be the global (1, 1)-form  $\Theta_{E,h} \in C^{\infty}(X, \Lambda^{1,1}T_X^* \otimes \text{End}(E))$ 

$$\Theta_{E,h} = \frac{i}{2\pi} \sum_{1 \le j,k \le n, 1 \le \lambda, \mu \le r} c_{jk\lambda\mu}(z) \, dz_j \wedge d\overline{z}_k \otimes e_\lambda^* \otimes e_\mu$$

locally computed as the matrix  $-\frac{i}{2\pi}\overline{\partial}(\overline{H}^{-1}\partial\overline{H})$  where  $H = (h_{\lambda\mu})$ . One has an associated hermitian form

$$\widetilde{\Theta}_{E,h}( au) = \sum c_{jk\lambda\mu}(z) \, au_{j\lambda} \overline{ au}_{k\mu}, \quad au \in \mathcal{T}_X \otimes E_{jk}$$

and one says that  $\Theta_{E,h} > 0$  (in the sense of Nakano) if  $\widetilde{\Theta}_{E,h}(\tau) > 0$  for all nonzero tensors  $\tau \in T_X \otimes E$ .

#### Kodaira embedding theorem

The special case of a holomorphic hermitian line bundle (L, h) is very interesting. Then one usually write the hermitian metric as  $h = e^{-\varphi}$  locally on a trivializing open set  $U \subset X$ , so that

$$\Theta_{L,h} = \frac{i}{2\pi} \partial \overline{\partial} \varphi = \frac{i}{2\pi} \sum_{j,k} \frac{\partial^2 \varphi}{\partial z_j \overline{\partial} z_k} \, dz_j \wedge \overline{z}_k,$$

and  $\Theta_{L,h} > 0$  means that  $\varphi$  is strictly plurisubharmonic.

#### Kodaira embedding theorem

The special case of a holomorphic hermitian line bundle (L, h) is very interesting. Then one usually write the hermitian metric as  $h = e^{-\varphi}$  locally on a trivializing open set  $U \subset X$ , so that

$$\Theta_{L,h} = rac{i}{2\pi} \partial \overline{\partial} \varphi = rac{i}{2\pi} \sum_{j,k} rac{\partial^2 \varphi}{\partial z_j \overline{\partial} z_k} \, dz_j \wedge \overline{z}_k,$$

and  $\Theta_{L,h} > 0$  means that  $\varphi$  is strictly plurisubharmonic.

Theorem (Kodaira 1953 - main reason for his Fields medal!) For X a compact complex manifold, TFAE : (i) L > 0, i.e. L possesses a smooth hermitian metric s.t.  $\Theta_{L,h} > 0$ ; (ii) L is ample, i.e. there exists a tensor power  $L^{\otimes m}$  and sections  $\sigma_0, \ldots, \sigma_N \in H^0(X, L^{\otimes m})$  such that  $X \to \mathbb{P}^N, \quad x \mapsto [\sigma_0(x) : \sigma_1(x) : \ldots : \sigma_N(x)] \in \mathbb{P}^N$  is an embedding.

## Kodaira embedding theorem

The special case of a holomorphic hermitian line bundle (L, h) is very interesting. Then one usually write the hermitian metric as  $h = e^{-\varphi}$  locally on a trivializing open set  $U \subset X$ , so that

$$\Theta_{L,h} = rac{i}{2\pi} \partial \overline{\partial} \varphi = rac{i}{2\pi} \sum_{j,k} rac{\partial^2 \varphi}{\partial z_j \overline{\partial} z_k} \, dz_j \wedge \overline{z}_k,$$

and  $\Theta_{L,h} > 0$  means that  $\varphi$  is strictly plurisubharmonic.

Theorem (Kodaira 1953 - main reason for his Fields medal!)

For X a compact complex manifold, TFAE :

(i) L > 0, i.e. L possesses a smooth hermitian metric s.t.  $\Theta_{L,h} > 0$ ; (ii) L is ample, i.e. there exists a tensor power  $L^{\otimes m}$  and sections  $\sigma_0, \ldots, \sigma_N \in H^0(X, L^{\otimes m})$  such that

 $X \to \mathbb{P}^N, \ x \mapsto [\sigma_0(x) : \sigma_1(x) : ... : \sigma_N(x)] \in \mathbb{P}^N$  is an embedding.

Then X is in fact an algebraic submanifold  $\{P_1 = \ldots = P_q = 0\}$  of  $\mathbb{P}^N$ , and one says that X is a projective algebraic manifold.

By Kodaira, non projective varieties do not have ample line bundles.

By Kodaira, non projective varieties do not have ample line bundles. In the Kähler case, a Kähler class  $\{\omega\} \in H^{1,1}(X,\mathbb{R}), \omega > 0$ , may sometimes be used as a substitute for a polarization.

By Kodaira, non projective varieties do not have ample line bundles. In the Kähler case, a Kähler class  $\{\omega\} \in H^{1,1}(X, \mathbb{R}), \omega > 0$ , may sometimes be used as a substitute for a polarization.

What for non Kähler compact complex manifolds?

By Kodaira, non projective varieties do not have ample line bundles. In the Kähler case, a Kähler class  $\{\omega\} \in H^{1,1}(X, \mathbb{R}), \omega > 0$ , may sometimes be used as a substitute for a polarization.

What for non Kähler compact complex manifolds?

#### Surprising fact (?)

Every compact complex manifold X carries a "very ample" complex Hilbert bundle, produced by means of a natural Bergman space construction; the curvature of this bundle is strongly positive and is given by a universal formula. In particular, X can be embedded holomorphically in a

"Hilbert Grassmannian" of infinite dimension and codimension.

Our goal is to investigate further this construction and explain potential applications to analytic geometry (Kähler invariance of plurigenera, transcendental holomorphic Morse inequalities...)

### Tubular Stein neighborhoods

Let X be a compact complex manifold,  $\dim_{\mathbb{C}} X = n$ .

Denote by  $\overline{X}$  its complex conjugate (X, -J), so that  $\mathcal{O}_{\overline{X}} = \overline{\mathcal{O}_X}$ .

## Tubular Stein neighborhoods

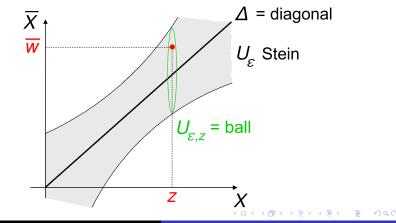

Let X be a compact complex manifold, dim<sub> $\mathbb{C}$ </sub> X = n.

Denote by  $\overline{X}$  its complex conjugate (X, -J), so that  $\mathcal{O}_{\overline{X}} = \overline{\mathcal{O}_X}$ .

The diagonal of  $X \times \overline{X}$  is totally real, and by Grauert, we know that it possesses a fundamental system of Stein tubular neighborhoods.

## Tubular Stein neighborhoods

Let X be a compact complex manifold,  $\dim_{\mathbb{C}} X = n$ . Denote by  $\overline{X}$  its complex conjugate (X, -J), so that  $\mathcal{O}_{\overline{X}} = \overline{\mathcal{O}_X}$ . The diagonal of  $X \times \overline{X}$  is totally real, and by Grauert, we know that it possesses a fundamental system of Stein tubular neighborhoods.

In the special case  $X = \mathbb{C}^n$ ,  $U_{\varepsilon} = \{(z, w); |\overline{z} - w| < \varepsilon\}$  is of course Stein since

$$|\bar{z} - w|^2 = |z|^2 + |w|^2 - 2\operatorname{Re}\sum z_j w_j$$

and  $(z, w) \mapsto \operatorname{Re} \sum z_j w_j$  is pluriharmonic.

In the special case  $X = \mathbb{C}^n$ ,  $U_{\varepsilon} = \{(z, w); |\overline{z} - w| < \varepsilon\}$  is of course Stein since

$$|\bar{z} - w|^2 = |z|^2 + |w|^2 - 2\operatorname{Re}\sum z_j w_j$$

and  $(z, w) \mapsto \operatorname{Re} \sum z_j w_j$  is pluriharmonic.

Technical lemma

Let exp :  $T_X \to X \times X$ ,  $(z, \xi) \mapsto (z, \exp_z(\xi))$  be the exponential map associated with a real analytic hermitian metric  $\gamma$  on X, and exph its "holomorphic" part, so that

$$\exp_{z}(\xi) = \sum_{\alpha,\beta \in \mathbb{N}^{n}} a_{\alpha\beta}(z) \xi^{\alpha} \overline{\xi}^{\beta}, \quad \exp_{z}(\xi) = \sum_{\alpha \in \mathbb{N}^{n}} a_{\alpha0}(z) \xi^{\alpha}.$$

In the special case  $X = \mathbb{C}^n$ ,  $U_{\varepsilon} = \{(z, w); |\overline{z} - w| < \varepsilon\}$  is of course Stein since

$$|\bar{z} - w|^2 = |z|^2 + |w|^2 - 2\operatorname{Re}\sum z_j w_j$$

and  $(z, w) \mapsto \operatorname{Re} \sum z_j w_j$  is pluriharmonic.

#### Technical lemma

Let exp :  $T_X \to X \times X$ ,  $(z, \xi) \mapsto (z, \exp_z(\xi))$  be the exponential map associated with a real analytic hermitian metric  $\gamma$  on X, and exph its "holomorphic" part, so that

$$\exp_{z}(\xi) = \sum_{\alpha,\beta \in \mathbb{N}^{n}} a_{\alpha\beta}(z)\xi^{\alpha}\overline{\xi}^{\beta}, \quad \exp_{z}(\xi) = \sum_{\alpha \in \mathbb{N}^{n}} a_{\alpha0}(z)\xi^{\alpha}.$$
  
Let logh :  $X \times X \supset W \to T_{X}$  be the inverse of exph and

 $U_{\varepsilon} = \{(z, w) \in X \times \overline{X}; | \operatorname{logh}_{z}(w)|_{\gamma} < \varepsilon\}, \quad \varepsilon > 0.$ 

In the special case  $X = \mathbb{C}^n$ ,  $U_{\varepsilon} = \{(z, w); |\overline{z} - w| < \varepsilon\}$  is of course Stein since

$$|\overline{z} - w|^2 = |z|^2 + |w|^2 - 2\operatorname{Re}\sum z_j w_j$$

and  $(z, w) \mapsto \operatorname{Re} \sum z_j w_j$  is pluriharmonic.

#### Technical lemma

Let exp :  $T_X \to X \times X$ ,  $(z, \xi) \mapsto (z, \exp_z(\xi))$  be the exponential map associated with a real analytic hermitian metric  $\gamma$  on X, and exph its "holomorphic" part, so that

$$\exp_z(\xi) = \sum_{\alpha,\beta \in \mathbb{N}^n} a_{\alpha\,\beta}(z) \xi^{\alpha} \overline{\xi}^{\beta}, \quad \exp_z(\xi) = \sum_{\alpha \in \mathbb{N}^n} a_{\alpha\,0}(z) \xi^{\alpha}.$$

Let  $logh: X \times X \supset W \rightarrow T_X$  be the inverse of exph and

 $U_{\varepsilon} = \{(z, w) \in X \times \overline{X}; | \operatorname{logh}_{z}(w)|_{\gamma} < \varepsilon\}, \quad \varepsilon > 0.$ 

Then, for  $\varepsilon \ll 1$ ,  $U_{\varepsilon}$  is Stein and  $\operatorname{pr}_1 : U_{\varepsilon} \to X$  is a real analytic locally trivial bundle with fibers biholomorphic to complex balls.

#### Bergman sheaves

Let  $U_{\varepsilon} = U_{\gamma,\varepsilon} \subset X \times \overline{X}$  be the ball bundle as above, and  $p = (\mathrm{pr}_1)_{|U_{\varepsilon}} : U_{\varepsilon} \to X, \qquad \overline{p} = (\mathrm{pr}_2)_{|U_{\varepsilon}} : U_{\varepsilon} \to \overline{X}$ 

the natural projections.

#### Definition

The "Bergman sheaf" 
$$\mathcal{B}_{\varepsilon} = \mathcal{B}_{\gamma,\varepsilon}$$
 is the  $L^2$  direct image  
 $\mathcal{B}_{\varepsilon} = p_*^{L^2}(\overline{p}^*\mathcal{O}(K_{\overline{X}})),$ 

i.e. the space of sections over an open subset  $V \subset X$  defined by  $\mathcal{B}_{\varepsilon}(V) =$  holomorphic sections f of  $\overline{p}^*\mathcal{O}(K_{\overline{X}})$  on  $p^{-1}(V)$ ,

$$f(z,w) = f_1(z,w) dw_1 \wedge \ldots \wedge dw_n, \quad z \in V,$$

that are in  $L^2(p^{-1}(K))$  for all compact subsets  $K \Subset V$  :

$$i^{n^2}f\wedge \overline{f}\wedge \gamma^n<+\infty,\quad \forall K\Subset V.$$

Then  $\mathcal{B}_{\varepsilon}$  is an  $\mathcal{O}_X$ -module, and by the Ohsawa-Takegoshi extension theorem applied to the subvariety  $p^{-1}(z) \subset U_{\varepsilon}$ , its fiber  $\mathcal{B}_{\varepsilon,z} = \mathcal{B}_{\varepsilon,z}/\mathfrak{m}_z \mathcal{B}_{\varepsilon,z}$  is isomorphic to the Hardy-Bergman space  $\mathcal{H}^2(B(0,\varepsilon))$  of  $L^2$  holomorphic *n*-forms on  $p^{-1}(z) \simeq B(0,\varepsilon) \subset \mathbb{C}^n$ .

Then  $\mathcal{B}_{\varepsilon}$  is an  $\mathcal{O}_X$ -module, and by the Ohsawa-Takegoshi extension theorem applied to the subvariety  $p^{-1}(z) \subset U_{\varepsilon}$ , its fiber  $\mathcal{B}_{\varepsilon,z} = \mathcal{B}_{\varepsilon,z}/\mathfrak{m}_z \mathcal{B}_{\varepsilon,z}$  is isomorphic to the Hardy-Bergman space  $\mathcal{H}^2(B(0,\varepsilon))$  of  $L^2$  holomorphic *n*-forms on  $p^{-1}(z) \simeq B(0,\varepsilon) \subset \mathbb{C}^n$ .

#### Question

By putting 
$$||f(z)||^2 = \int_{p^{-1}(z)} i^{n^2} f \wedge \overline{f}$$
, we get a (real analytic) locally trivial Hilbert bundle  $B_{\varepsilon} \to X$ .

Then  $\mathcal{B}_{\varepsilon}$  is an  $\mathcal{O}_X$ -module, and by the Ohsawa-Takegoshi extension theorem applied to the subvariety  $p^{-1}(z) \subset U_{\varepsilon}$ , its fiber  $\mathcal{B}_{\varepsilon,z} = \mathcal{B}_{\varepsilon,z}/\mathfrak{m}_z \mathcal{B}_{\varepsilon,z}$  is isomorphic to the Hardy-Bergman space  $\mathcal{H}^2(B(0,\varepsilon))$  of  $L^2$  holomorphic *n*-forms on  $p^{-1}(z) \simeq B(0,\varepsilon) \subset \mathbb{C}^n$ .

#### Question

By putting 
$$||f(z)||^2 = \int_{p^{-1}(z)} i^{n^2} f \wedge \overline{f}$$
, we get a (real analytic)  
locally trivial Hilbert bundle  $B_{\varepsilon} \to X$ .  
Is there a "complex structure" on  $B_{\varepsilon}$  such that  $\mathcal{B}_{\varepsilon} = \mathcal{O}(B_{\varepsilon})$ ?

Then  $\mathcal{B}_{\varepsilon}$  is an  $\mathcal{O}_X$ -module, and by the Ohsawa-Takegoshi extension theorem applied to the subvariety  $p^{-1}(z) \subset U_{\varepsilon}$ , its fiber  $\mathcal{B}_{\varepsilon,z} = \mathcal{B}_{\varepsilon,z}/\mathfrak{m}_z \mathcal{B}_{\varepsilon,z}$  is isomorphic to the Hardy-Bergman space  $\mathcal{H}^2(B(0,\varepsilon))$  of  $L^2$  holomorphic *n*-forms on  $p^{-1}(z) \simeq B(0,\varepsilon) \subset \mathbb{C}^n$ .

#### Question

By putting 
$$||f(z)||^2 = \int_{p^{-1}(z)} i^{n^2} f \wedge \overline{f}$$
, we get a (real analytic)  
locally trivial Hilbert bundle  $B_{\varepsilon} \to X$ .  
Is there a "complex structure" on  $B_{\varepsilon}$  such that  $\mathcal{B}_{\varepsilon} = \mathcal{O}(B_{\varepsilon})$ ?

For this, consider the "Bergman Dolbeault" complex  $\overline{\partial} : \mathcal{F}_{\varepsilon}^{q} \to \mathcal{F}_{\varepsilon}^{q+1}$ over X, with  $\mathcal{F}_{\varepsilon}^{q}(V) = \text{smooth } (n,q)$ -forms  $f(z,w) = \sum_{|J|=q} f_{J}(z,w) dw_{1} \wedge ... \wedge dw_{n} \wedge d\overline{z}_{J}, \quad (z,w) \in U_{\varepsilon} \cap (V \times \overline{X}),$  $f_{J}(z,w)$  holomorphic in w and all  $\overline{\partial}_{z}f(z,w) \in L^{2}(p^{-1}(K)), K \subseteq V.$ 

# Very ampleness of Bergman bundles

By construction,  $\overline{\partial}$  yields a complex of sheaves  $(\mathcal{F}^{\bullet}, \overline{\partial})$  and the kernel Ker  $\overline{\partial} : \mathcal{F}^{0} \to \mathcal{F}^{1}$  coincides with  $\mathcal{B}_{\varepsilon}$ .

#### Theorem

Assume that  $\varepsilon > 0$  is taken so small that  $\psi(z, w) := |\operatorname{logh}_z(w)|^2$ is strictly plurisubharmonic up to the boundary on the compact set  $\overline{U}_{\varepsilon} \subset X \times \overline{X}$ . Then the complex of sheaves  $(\mathcal{F}^{\bullet}, \overline{\partial})$  is a resolution of  $\mathcal{B}_{\varepsilon}$  by soft sheaves over X (actually, by  $\mathcal{C}_X^{\infty}$ -modules), and for every holomorphic vector bundle  $E \to X$  we have

$$H^q(X, \mathcal{B}_{\varepsilon} \otimes \mathcal{O}(E)) = H^q\big(\Gamma(X, \mathcal{F}^{ullet}_{\varepsilon} \otimes \mathcal{O}(E)), \overline{\partial}\big) = 0, \quad \forall q \geq 1.$$

Moreover the fibers  $B_{\varepsilon,z} \otimes E_z$  are always generated by global sections of  $H^0(X, \mathcal{B}_{\varepsilon} \otimes \mathcal{O}(E))$ .

In other words,  $B_{\varepsilon}$  is a "very ample holomorphic vector bundle" (as a Hilbert bundle of infinite dimension).

# Very ampleness of Bergman bundles

By construction,  $\overline{\partial}$  yields a complex of sheaves  $(\mathcal{F}^{\bullet}, \overline{\partial})$  and the kernel Ker  $\overline{\partial} : \mathcal{F}^{0} \to \mathcal{F}^{1}$  coincides with  $\mathcal{B}_{\varepsilon}$ .

#### Theorem

Assume that  $\varepsilon > 0$  is taken so small that  $\psi(z, w) := |\operatorname{logh}_z(w)|^2$ is strictly plurisubharmonic up to the boundary on the compact set  $\overline{U}_{\varepsilon} \subset X \times \overline{X}$ . Then the complex of sheaves  $(\mathcal{F}^{\bullet}, \overline{\partial})$  is a resolution of  $\mathcal{B}_{\varepsilon}$  by soft sheaves over X (actually, by  $\mathcal{C}_X^{\infty}$ -modules), and for every holomorphic vector bundle  $E \to X$  we have

 $H^q(X, \mathcal{B}_{\varepsilon} \otimes \mathcal{O}(E)) = H^qig( \Gamma(X, \mathcal{F}^{ullet}_{\varepsilon} \otimes \mathcal{O}(E)), \overline{\partial} ig) = 0, \quad \forall q \geq 1.$ 

Moreover the fibers  $B_{\varepsilon,z} \otimes E_z$  are always generated by global sections of  $H^0(X, \mathcal{B}_{\varepsilon} \otimes \mathcal{O}(E))$ .

In other words,  $B_{\varepsilon}$  is a "very ample holomorphic vector bundle" (as a Hilbert bundle of infinite dimension). But it is NOT holomorphically locally trivial.

Since we have a natural  $\nabla^{0,1} = \overline{\partial}$  connection, and a natural hermitian metric on the Bergman bundle, it follows that  $B_{\varepsilon}$  can be equipped with a unique Chern connection.

Since we have a natural  $\nabla^{0,1} = \overline{\partial}$  connection, and a natural hermitian metric on the Bergman bundle, it follows that  $B_{\varepsilon}$  can be equipped with a unique Chern connection.

Model case:  $X = \mathbb{C}^n$ ,  $\gamma =$  standard hermitian metric.

Since we have a natural  $\nabla^{0,1} = \overline{\partial}$  connection, and a natural hermitian metric on the Bergman bundle, it follows that  $B_{\varepsilon}$  can be equipped with a unique Chern connection.

**Model case:**  $X = \mathbb{C}^n$ ,  $\gamma =$  **standard hermitian metric.** Then one sees that a (non holomorphic) orthonormal frame of  $B_{\varepsilon}$  is given by

$$e_{lpha}(z,w) = \pi^{-n/2} arepsilon^{-|lpha|-n} \sqrt{rac{(|lpha|+n)!}{lpha_1!\dotslpha_n!}} \, (w-\overline{z})^{lpha}, \quad lpha \in \mathbb{N}^n.$$

A (10) × (10) × (10) ×

Since we have a natural  $\nabla^{0,1} = \overline{\partial}$  connection, and a natural hermitian metric on the Bergman bundle, it follows that  $B_{\varepsilon}$  can be equipped with a unique Chern connection.

**Model case:**  $X = \mathbb{C}^n$ ,  $\gamma =$  **standard hermitian metric.** Then one sees that a (non holomorphic) orthonormal frame of  $B_{\varepsilon}$  is given by

$$e_{\alpha}(z,w) = \pi^{-n/2} \varepsilon^{-|\alpha|-n} \sqrt{\frac{(|\alpha|+n)!}{\alpha_1! \dots \alpha_n!}} (w-\overline{z})^{\alpha}, \quad \alpha \in \mathbb{N}^n.$$

The (0,1)-connection  $\nabla^{0,1}=\overline{\partial}$  is given by

$$\nabla^{0,1} e_{\alpha} = \overline{\partial}_{z} e_{\alpha}(z, w) = \varepsilon^{-1} \sum_{1 \leq j \leq n} \sqrt{\alpha_{j}(|\alpha| + n)} \ d\overline{z}_{j} \otimes e_{\alpha - c_{j}}$$
  
where  $c_{j} = (0, ..., 1, ..., 0) \in \mathbb{N}^{n}$ .

### Curvature of Bergman bundles

Let  $\Theta_{B_{\varepsilon},h} = \nabla^{1,0} \nabla^{0,1} + \nabla^{0,1} \nabla^{1,0}$  be the curvature tensor of  $B_{\varepsilon}$  with its natural Hilbertian metric h, and

 $\Theta_{\varepsilon}(\mathbf{v}\otimes\xi)=\langle\Theta_{B_{\varepsilon},h}\sigma(\mathbf{v},J\mathbf{v})\xi,\xi\rangle_{h}$ 

the associated quadratic form with  $v \in T_X$ ,  $\xi = \sum_{\alpha} \xi_{\alpha} e_{\alpha} \in B_{\varepsilon}$ .

#### Formula

In the model case  $X = \mathbb{C}^n$ , the curvature tensor of the Bergman bundle  $(B_{\varepsilon}, h)$  is given by

$$\widetilde{\Theta}_{\varepsilon}(\mathbf{v}\otimes\xi) = \varepsilon^{-2}\sum_{\alpha\in\mathbb{N}^n} \left( \left|\sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} \mathbf{v}_j\right|^2 + \sum_j (|\alpha|+n) |\xi_{\alpha}|^2 |\mathbf{v}_j|^2 \right).$$

# Curvature of Bergman bundles

Let  $\Theta_{B_{\varepsilon},h} = \nabla^{1,0} \nabla^{0,1} + \nabla^{0,1} \nabla^{1,0}$  be the curvature tensor of  $B_{\varepsilon}$  with its natural Hilbertian metric h, and

 $\Theta_{arepsilon}(\mathbf{v}\otimes\xi)=\langle\Theta_{B_{arepsilon},h}\sigma(\mathbf{v},J\mathbf{v})\xi,\xi
angle_{h}$ 

the associated quadratic form with  $v \in T_X$ ,  $\xi = \sum_{\alpha} \xi_{\alpha} e_{\alpha} \in B_{\varepsilon}$ .

#### Formula

In the model case  $X = \mathbb{C}^n$ , the curvature tensor of the Bergman bundle  $(B_{\varepsilon}, h)$  is given by

$$\widetilde{\Theta}_{\varepsilon}(\mathbf{v}\otimes\xi) = \varepsilon^{-2} \sum_{\alpha\in\mathbb{N}^n} \left( \left|\sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} \mathbf{v}_j\right|^2 + \sum_j (|\alpha|+n) |\xi_{\alpha}|^2 |\mathbf{v}_j|^2 \right).$$

Observe that  $\Theta_{\varepsilon}(v \otimes \xi)$  is a positive but unbounded quadratic form on  $B_{\varepsilon}$  with respect to the standard norm  $\|\xi\|^2 = \sum_{\alpha} |\xi_{\alpha}|^2$ .

# Curvature of Bergman bundles

Let  $\Theta_{B_{\varepsilon},h} = \nabla^{1,0} \nabla^{0,1} + \nabla^{0,1} \nabla^{1,0}$  be the curvature tensor of  $B_{\varepsilon}$  with its natural Hilbertian metric h, and

 $\Theta_{arepsilon}(\mathbf{v}\otimes\xi)=\langle\Theta_{B_{arepsilon},h}\sigma(\mathbf{v},J\mathbf{v})\xi,\xi
angle_{h}$ 

the associated quadratic form with  $v \in T_X$ ,  $\xi = \sum_{\alpha} \xi_{\alpha} e_{\alpha} \in B_{\varepsilon}$ .

#### Formula

In the model case  $X = \mathbb{C}^n$ , the curvature tensor of the Bergman bundle  $(B_{\varepsilon}, h)$  is given by

$$\widetilde{\Theta}_{\varepsilon}(\mathbf{v}\otimes\xi) = \varepsilon^{-2} \sum_{\alpha\in\mathbb{N}^n} \left( \left|\sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} \mathbf{v}_j\right|^2 + \sum_j (|\alpha|+n) |\xi_{\alpha}|^2 |\mathbf{v}_j|^2 \right).$$

Observe that  $\Theta_{\varepsilon}(v \otimes \xi)$  is a positive but unbounded quadratic form on  $B_{\varepsilon}$  with respect to the standard norm  $\|\xi\|^2 = \sum_{\alpha} |\xi_{\alpha}|^2$ . However there is convergence for all  $\xi = \sum_{\alpha} \xi_{\alpha} e_{\alpha} \in B_{\rho\varepsilon}$ ,  $\rho > 1$ , since then  $\sum_{\alpha} \rho^{2|\alpha|} |\xi_{\alpha}|^2 < +\infty$ .

# Curvature of Bergman bundles (general case)

#### Bergman curvature formula on a general hermitian manifold

Let X be a compact complex manifold equipped with a hermitian metric  $\gamma$ , and  $B_{\varepsilon} = B_{\gamma,\varepsilon}$  the corresponding Bergman bundle. Then its curvature is given by an asymptotic expansion

$$\widetilde{\Theta}_{\varepsilon}(z, v \otimes \xi) = \sum_{p=0}^{+\infty} \varepsilon^{-2+p} Q_p(z, v \otimes \xi)$$

## Curvature of Bergman bundles (general case)

#### Bergman curvature formula on a general hermitian manifold

Let X be a compact complex manifold equipped with a hermitian metric  $\gamma$ , and  $B_{\varepsilon} = B_{\gamma,\varepsilon}$  the corresponding Bergman bundle. Then its curvature is given by an asymptotic expansion

$$\widetilde{\Theta}_{\varepsilon}(z, v \otimes \xi) = \sum_{p=0}^{\infty} \varepsilon^{-2+p} Q_p(z, v \otimes \xi)$$
  
where  $Q_0(z, v \otimes \xi) = Q_0(v \otimes \xi)$  is given by the model case  $\mathbb{C}^n$ :  
 $Q_0(v \otimes \xi) = \varepsilon^{-2} \sum_{\alpha \in \mathbb{N}^n} \left( \left| \sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} v_j \right|^2 + \sum_j (|\alpha|+n) |\xi_{\alpha}|^2 |v_j|^2 \right).$

 $+\infty$ 

$$\begin{split} \widetilde{\Theta}_{\varepsilon}(z, v \otimes \xi) &= \sum_{p=0} \varepsilon^{-2+p} Q_p(z, v \otimes \xi) \\ \text{here } Q_0(z, v \otimes \xi) &= Q_0(v \otimes \xi) \text{ is given by the model case } \mathbb{C}^n : \\ \mathfrak{g}(v \otimes \xi) &= \varepsilon^{-2} \sum_{\alpha \in \mathbb{N}^n} \left( \left| \sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} v_j \right|^2 + \sum_j (|\alpha|+n) |\xi_{\alpha}|^2 |v_j|^2 \right) \\ \text{he other terms } Q_p(z, v \otimes \xi) \text{ are real analytic and depend on the rsion and curvature tensor of } \gamma, \text{ especially } Q_1, Q_2. \end{split}$$

### Curvature of Bergman bundles (general case)

### Bergman curvature formula on a general hermitian manifold

Let X be a compact complex manifold equipped with a hermitian metric  $\gamma$ , and  $B_{\varepsilon} = B_{\gamma,\varepsilon}$  the corresponding Bergman bundle. Then its curvature is given by an asymptotic expansion

$$\widetilde{\Theta}_{\varepsilon}(z, v \otimes \xi) = \sum_{p=0}^{\infty} \varepsilon^{-2+p} Q_p(z, v \otimes \xi)$$
$$v \otimes \xi) = Q_0(v \otimes \xi) \text{ is given by the model } \psi$$

where  $Q_0(z, v \otimes \xi) = Q_0(v \otimes \xi)$  is given by the model case  $\mathbb{C}^n$ :  $Q_0(v \otimes \xi) = \varepsilon^{-2} \sum_{\alpha \in \mathbb{N}^n} \left( \left| \sum_j \sqrt{\alpha_j} \xi_{\alpha-c_j} v_j \right|^2 + \sum_j (|\alpha| + n) |\xi_{\alpha}|^2 |v_j|^2 \right)$ . The other terms  $Q_p(z, v \otimes \xi)$  are real analytic and depend on the torsion and curvature tensor of  $\gamma$ , especially  $Q_1, Q_2$ .

A consequence of the above formula is that  $B_{\varepsilon}$  is strongly Nakano positive for  $\varepsilon > 0$  small enough.

## Transcendental holomorphic Morse inequalities

### Conjecture

Let X be a compact *n*-dimensional complex manifold and  $\alpha \in H^{1,1}_{BC}(X, \mathbb{R})$  a Bott-Chern class, represented by closed real (1,1)-forms modulo  $\partial \overline{\partial}$  exact forms. Set

$$\operatorname{Vol}(\alpha) = \sup_{T = \alpha + i\partial\overline{\partial}\varphi \ge 0} \int_X T_{ac}^n, \quad T \ge 0 \text{ current}.$$

## Transcendental holomorphic Morse inequalities

### Conjecture

Let X be a compact *n*-dimensional complex manifold and  $\alpha \in H^{1,1}_{BC}(X, \mathbb{R})$  a Bott-Chern class, represented by closed real (1, 1)-forms modulo  $\partial\overline{\partial}$  exact forms. Set

$$\operatorname{Vol}(\alpha) = \sup_{T=\alpha+i\partial\overline{\partial}\varphi \ge 0} \int_X T^n_{ac}, \quad T \ge 0 \text{ current.}$$
$$\operatorname{Vol}(\alpha) \ge \sup_{u \in \{\alpha\}, \ u \in C^\infty} \int_{X(u,0)} u^n$$

where

Then

X(u,0) = 0-index set of  $u = \{x \in X ; u(x) \text{ positive definite}\}.$

$$\operatorname{Vol}(\alpha) \geq \sup_{u \in \{\alpha\}, \ u \in C^{\infty}} \int_{X(u,0)} u^{r}$$

where

X(u,0) = 0-index set of  $u = \{x \in X ; u(x) \text{ positive definite}\}.$ 

Conjectural corollary (fundamental volume estimate)

Let X be compact Kähler, dim X = n, and  $\alpha, \beta \in H^{1,1}(X, \mathbb{R})$  be nef classes. Then  $\operatorname{Vol}(\alpha - \beta) > \alpha^n - n\alpha^{n-1} \cdot \beta.$ 

The conjecture on Morse inequalities is known to be true when  $\alpha = c_1(L)$  is the class of a line bundle ([D-1985]), and the corollary can be derived from this when  $\alpha, \beta$  are integral classes (by [D-1993] and independently by [Trapani, 1993]).

The conjecture on Morse inequalities is known to be true when  $\alpha = c_1(L)$  is the class of a line bundle ([D-1985]), and the corollary can be derived from this when  $\alpha, \beta$  are integral classes (by [D-1993] and independently by [Trapani, 1993]).

Recently, the volume estimate for  $\alpha$ ,  $\beta$  transcendental has been established by D. Witt-Nyström when X is projective, and Xiao-Popovici even proved in general that  $Vol(\alpha - \beta) > 0$  if  $\alpha^n - n\alpha^{n-1} \cdot \beta > 0$ .

Then apply  $L^{2}$  direct image  $(\operatorname{pr}_{1})_{*}^{L^{2}}$  and use Bergman estimates instead of dimension counts in Morse inequalities.

## Invariance of plurigenera for polarized families of compact Kähler manifolds

#### Conjecture

Let  $\pi : \mathcal{X} \to S$  be a proper holomorphic map defining a family of smooth compact Kähler manifolds over an irreducible base S. Assume that the family admits a polarization, i.e. a closed smooth (1, 1)-form  $\omega$  such that  $\omega_{|X_t}$  is positive definite on each fiber  $X_t := \pi^{-1}(t)$ . Then the plurigenera

 $p_m(X_t) = h^0(X_t, mK_{X_t})$  are independent of t for all  $m \ge 0$ .

 $p_m(X_t) = h^0(X_t, mK_{X_t})$  are independent of t for all  $m \ge 0$ .

The conjecture is known to be true for a projective family  $\mathcal{X} \rightarrow S$ :

- Siu and Kawamata (1998) in the case of varieties of general type
- Siu (2000) and Păun (2004) in the arbitrary projective case

No algebraic proof is known in the latter case; one uses deeply the Ohsawa-Takegoshi  $L^2$  extension theorem.

It is enough to consider the case of a family  $\mathcal{X} \to \Delta$  over the disc, such that there exists a relatively ample line bundle  $\mathcal{A}$  over  $\mathcal{X}$ .

It is enough to consider the case of a family  $\mathcal{X} \to \Delta$  over the disc, such that there exists a relatively ample line bundle  $\mathcal{A}$  over  $\mathcal{X}$ .

Given  $s \in H^0(X_0, mK_{X_0})$ , the point is to show that it extends into  $\tilde{s} \in H^0(\mathcal{X}, mK_{\mathcal{X}})$ , and for this, one only needs to produce a hermitian metric  $h = e^{-\varphi}$  on  $K_{\mathcal{X}}$  such that:

- $\Theta_h = i\partial\overline{\partial}\varphi \ge 0$  in the sense of currents
- $|s|_h^2 \leq 1$ , i.e.  $\varphi \geq \log |s|$  on  $X_0$ .

The Ohsawa-Takegoshi theorem then implies the existence of  $\tilde{s}$ .

伺 ト イヨト イヨト

It is enough to consider the case of a family  $\mathcal{X} \to \Delta$  over the disc, such that there exists a relatively ample line bundle  $\mathcal{A}$  over  $\mathcal{X}$ .

Given  $s \in H^0(X_0, mK_{X_0})$ , the point is to show that it extends into  $\tilde{s} \in H^0(\mathcal{X}, mK_{\mathcal{X}})$ , and for this, one only needs to produce a hermitian metric  $h = e^{-\varphi}$  on  $K_{\mathcal{X}}$  such that:

- $\Theta_h = i \partial \overline{\partial} \varphi \ge 0$  in the sense of currents
- $|s|_h^2 \leq 1$ , i.e.  $\varphi \geq \log |s|$  on  $X_0$ .

The Ohsawa-Takegoshi theorem then implies the existence of  $\tilde{s}$ .

To produce  $h = e^{-\varphi}$ , one defines inductively sections of  $\sigma_{p,j}$  of  $\mathcal{L}_p := \mathcal{A} + p \mathcal{K}_{\mathcal{X}}$  such that:

•  $(\sigma_{p,j})$  generates  $\mathcal{L}_p$  for  $0 \leq p < m$ 

• 
$$\sigma_{p,j}$$
 extends  $(\sigma_{p-m,j}s^m)|_{X_0}$  to  $\mathcal{X}$  for  $p \ge m$ 

• 
$$\int_{\mathcal{X}} \frac{\sum_{j \mid \sigma_{p,j} \mid j}}{\sum_{i \mid \sigma_{p-1,j} \mid j}} \leq C \text{ for } p \geq 1.$$

・ 何 ト ・ ヨ ト ・ ヨ ト

By Hölder, the  $L^2$  estimates imply  $\int_{\mathcal{X}} \left( \sum_j |\sigma_{p,j}|^2 \right)^{1/p} \leq C$  for all p, and using the fact that  $\lim \frac{1}{p} \Theta_{\mathcal{A}} = 0$ , one can take

 $\varphi = \limsup_{p \to +\infty} \frac{1}{p} \log \sum_{j} |\sigma_{p,j}|^2.$ 

By Hölder, the  $L^2$  estimates imply  $\int_{\mathcal{X}} \left( \sum_j |\sigma_{p,j}|^2 \right)^{1/p} \leq C$  for all p, and using the fact that  $\lim \frac{1}{p} \Theta_{\mathcal{A}} = 0$ , one can take

 $\varphi = \limsup_{p \to +\infty} \frac{1}{p} \log \sum_{j} |\sigma_{p,j}|^2.$ 

**Idea.** In the polarized Kähler case, use the Bergman bundle  $B_{\varepsilon} \to \mathcal{X}$  instead of an ample line bundle  $\mathcal{A} \to \mathcal{X}$ . This amounts to applying the Ohsawa-Takegoshi  $L^2$  extension on Stein tubular neighborhoods  $U_{\varepsilon} \subset \mathcal{X} \times \overline{\mathcal{X}}$ , with projections  $\operatorname{pr}_1 : U_{\varepsilon} \to \mathcal{X}$  and  $\pi : \mathcal{X} \to \Delta$ .

By Hölder, the  $L^2$  estimates imply  $\int_{\mathcal{X}} \left( \sum_j |\sigma_{p,j}|^2 \right)^{1/p} \leq C$  for all p, and using the fact that  $\lim \frac{1}{p} \Theta_{\mathcal{A}} = 0$ , one can take

 $\varphi = \limsup_{p \to +\infty} \frac{1}{p} \log \sum_{j} |\sigma_{p,j}|^2.$ 

**Idea.** In the polarized Kähler case, use the Bergman bundle  $B_{\varepsilon} \to \mathcal{X}$  instead of an ample line bundle  $\mathcal{A} \to \mathcal{X}$ . This amounts to applying the Ohsawa-Takegoshi  $L^2$  extension on Stein tubular neighborhoods  $U_{\varepsilon} \subset \mathcal{X} \times \overline{\mathcal{X}}$ , with projections  $\mathrm{pr}_1 : U_{\varepsilon} \to \mathcal{X}$  and  $\pi : \mathcal{X} \to \Delta$ .

#### Proposition

In the polarized Kähler case  $(\mathcal{X}, \omega)$ , shrinking from  $U_{\rho\varepsilon}$ ,  $\rho > 1$ , to  $U_{\varepsilon}$ , one gets

$$\partial\overline{\partial}\Big(\sum_{j}\|\sigma_{
ho,j}\|_{U_arepsilon}^2\Big)^{\lambda/
ho}\geq -arepsilon^{-2}(\log
ho)^{-1}
ho^{n\lambda/
ho}e^{C\lambda}\omega\quadorall\lambda>0.$$

By Hölder, the  $L^2$  estimates imply  $\int_{\mathcal{X}} \left( \sum_j |\sigma_{p,j}|^2 \right)^{1/p} \leq C$  for all p, and using the fact that  $\lim \frac{1}{p} \Theta_{\mathcal{A}} = 0$ , one can take

 $\varphi = \limsup_{p \to +\infty} \frac{1}{p} \log \sum_{j} |\sigma_{p,j}|^2.$ 

**Idea.** In the polarized Kähler case, use the Bergman bundle  $B_{\varepsilon} \to \mathcal{X}$  instead of an ample line bundle  $\mathcal{A} \to \mathcal{X}$ . This amounts to applying the Ohsawa-Takegoshi  $L^2$  extension on Stein tubular neighborhoods  $U_{\varepsilon} \subset \mathcal{X} \times \overline{\mathcal{X}}$ , with projections  $\mathrm{pr}_1 : U_{\varepsilon} \to \mathcal{X}$  and  $\pi : \mathcal{X} \to \Delta$ .

#### Proposition

In the polarized Kähler case  $(\mathcal{X}, \omega)$ , shrinking from  $U_{\rho\varepsilon}$ ,  $\rho > 1$ , to  $U_{\varepsilon}$ , one gets

$$i\partial\overline{\partial}\Big(\sum_{j}\|\sigma_{p,j}\|_{U_{arepsilon}}^{2}\Big)^{\lambda/p}\geq -arepsilon^{-2}(\log
ho)^{-1}
ho^{n\lambda/p}e^{C\lambda}\omega\quad orall\lambda>0.$$

This is enough to imply the invariance of plurigenera if  $\varepsilon > 0$  can be taken arbitrarily large.
